

Adjustable Horizontal Linearity Coils

TRANSFORMERS & COILS

FEATURES:

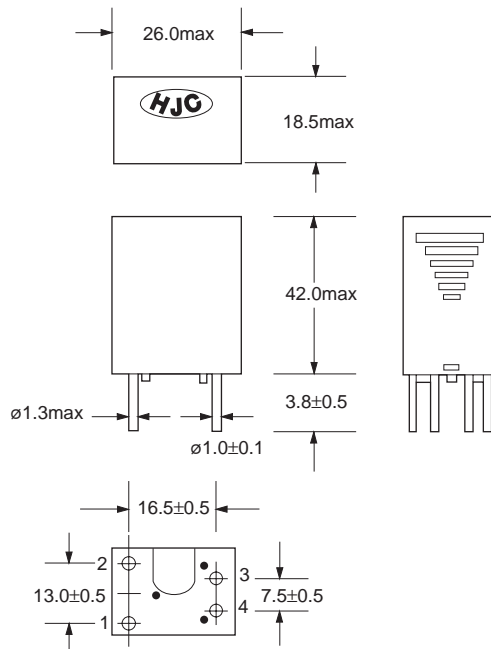

This product is designed to couple with linearity and control coils for horizontal picture image control. The horizontal picture image is controlled by the linearity coil if monitors working below 30 KHz. The image is also stabilized by the control coil (that pass on about 200 mA to produce magnetic field inductance) when working above 30 KHz.

APPLICATIONS:

For monitors (15 inches and above) working with a frequency around 30 KHz that require different output signal change.
